

# LOWERING INVENTORY COSTS, INCREASING LOGISTIC PERFORMANCE.

BECOME YOUR OWN LOGISTICS CONSULTANT –  
WITH THE INVENTORY HEALTH CHECK.

## YOUR BENEFITS

- ✓ Transparency for the current warehouse status
- ✓ Quick overview with visualizations
- ✓ Reliable figures for better decisions
- ✓ Fast identification of optimization potentials
- ✓ Foundation for rule-based scheduling
- ✓ High-quality data for intelligent evaluations

Excess inventory generates unnecessary operating costs. Low inventory causes substantial costs for unavailable parts. Long procurement cycles, complex article structures or volatile consumption characteristics reduce the capacity of your logistics. Relevant scheduling parameters – recorded correctly and maintained continuously – offer unexpected optimization potential. Often, however, there are not enough resources and know-how to take on this task in the long term. With the **“Inventory Health Check” app**, we have developed a tool that gives you the required transparency regarding your current inventory situation. **Use the app to identify inventory and coverage drivers yourself.** Recognize areas that require action and examine these in detail. We determine suggested measures together – **so you can increase your logistics capacity!**

## INVENTORY HEALTH CHECK – IN COOPERATION WITH LIS

We developed the Inventory Health Check in close cooperation with our partner LIS (Logistics Improvement Services). This provides you with a tool that lets you independently uncover efficiency improvement potential in your inventory. Avoid expensive capital commitment from excess inventory and always keep an overview of the current situation in the warehouse. The coverage categories show you exactly which articles move at which speed and allow you to easily and quickly identify slow-moving and fast-moving items. You can immediately detect excess and low inventory while an evaluation of the entire data pool provides an initial assessment of your potential for reducing inventory. The gained findings help to use the status-quo analysis for optimizations in the shortest time possible.

**LIS.**  
Logistics Improvement Services

### Your inventory situation.

- Providing the logistics data of your ERP system
- Data-based inventory & consumption analysis
- Creating a solid information basis for additional scenarios

### Identify required actions.

- Coverage & delivery time categories provide transparency
- Identifying causes for status quo problems & fields of action
- Initial forecast assessment of a rationalization potential

### Derive measures.

- For implementing a precisely tailored coverage strategy
- For higher supply performance and flexibility
- For better management information

## AND WHAT HAPPENS WITH THE RESULTS?

Our **Inventory Health Check app family** will comprise two additional applications. The **Scenario Management app** uses the Inventory Health Check to go through variable scheduling parameters for different acquisition scenarios, with article groups and the ABC/XYZ classification among the key parameters. The objective is to find the right acquisition strategy that meets your demands in terms of availability and inventory levels.

Scenario Management is followed by **Monitoring**. The third app allows you to continuously keep an eye on the most important KPIs and processes of the supply chain. For this purpose, we work with you to define relevant key figures, ensuring successful implementation of the acquisition strategy selected in the Scenario Management. This includes, for example, the development of coverage and availability as well as inbound and outbound performance.
